Approximation Algorithms

1 Approximation Classes

2 Approximation Algorithms

Approximation Classes

NPO: NP optimization problems

APX: constant factor ϵ -approximation ($\epsilon > 1$)

$f(n)$ -APX: Exp-APX, Poly-APX, Log-APX

PTAS: ▶ $\forall \epsilon > 0 : (1 + \epsilon)$ -approximation

▶ $P : \text{Poly}(n) \quad O(n^{2/\epsilon}) \quad O(n^{2^{2^{1/\epsilon}}})$

FPTAS: ▶ $\forall \epsilon > 0 : (1 + \epsilon)$ -approximation

▶ $FP : \text{Poly}(n, 1/\epsilon) \quad O((1/\epsilon)^2 \cdot n^3)$

PO: polynomial time solvable optimization problems

Approximation Classes

$$\begin{aligned}
 \text{PO} \subsetneq \text{FPTAS} \subsetneq \text{PTAS} \subsetneq \text{APX} \\
 \subsetneq \text{Log-APX} \subsetneq \text{Poly-APX} \subsetneq \text{Exp-APX} \subsetneq \text{NPO} \\
 (\text{if } P \neq NP)
 \end{aligned}$$

1. Knapsack $\in \text{FPTAS} \setminus \text{PO}$
2. Makespan $\in \text{PTAS} \setminus \text{FPTAS}$ (TODAY)
3. Vertex Cover $\in \text{APX} \setminus \text{PTAS}$
4. Set Cover $\in \text{Log-APX} \setminus \text{APX}$ (CLRS 35.3)
5. Clique $\in \text{Poly-APX} \setminus \text{Log-APX}$
6. TSP $\in \text{Exp-APX} \setminus \text{Poly-APX}$

Stability of approximation

Stability of approximation

Approximation Algorithms

- 1 Approximation Classes
- 2 Approximation Algorithms
 - Makespan Scheduling Problem

Makespan scheduling problem

Makespan scheduling problem (MS)

- ▶ n jobs: J_1, \dots, J_n
- ▶ processing time: p_1, \dots, p_n
- ▶ $m \geq 2$ machines: M_1, \dots, M_m
- ▶ goal: minimize the makespan

MS is NP-complete

Definition (Partition)

Instance:

$$\forall a \in A : s(a) \in \mathbb{Z}^+$$

Question: Is there a subset $A' \subseteq A$:

$$\sum_{a \in A'} s(a) = \sum_{a \in A \setminus A'} s(a)$$

$$A = \{5, 1, 3, 4, 8, 2, 7\} \implies A' = \{5, 3, 7\}, A \setminus A' = \{1, 2, 4, 8\}$$

MS is strongly NP-complete

Definition (3-Partition)

Instance:

$$|A| = 3m, B \in \mathbb{Z}^+ \\ \forall a \in A : s(a) \in \mathbb{Z}^+, B/4 < s(a) < B/2$$

Question: Can A be partitioned into m disjoint sets S_1, \dots, S_m :

$$\forall 1 \leq i \leq m : |S_i| = 3, \sum_{a \in S_i} s(a) = B$$

$$A = \{1, 2, 2, 3, 3, 4, 6, 7, 8\}, m = 3, B = 12 \implies \{1, 3, 8; 2, 4, 6; 2, 3, 7\}$$

List-Scheduling (LS) algorithm

List-Scheduling algorithm (JH 4.2.1.4)

- ▶ online
- ▶ assign job to the least heavily loaded

$$J = 2, 3, 4, 6, 2, 2 \quad m = 3$$

LS is 2-approx.

$$T \text{ vs. } T^* : \frac{T}{T^*}$$

$$T^* \geq \frac{1}{m} \sum_j t_j$$

$$T^* \geq \max_j t_j$$

1. M_i : with the maximum load
2. J_i : the last job on M_i

$$ms_i \leq \sum_j t_j \implies s_i \leq \frac{1}{m} \sum_j t_j \leq T^*$$

$$T = c_i = s_i + p_i \leq T^* + T^* = 2T^*$$

2-approx. is (almost) tight

$$n = \underbrace{m(m-1)}_{p_i=1} + \underbrace{1}_{p_i=m}$$

$$\frac{T}{T^*} = \frac{2m-1}{m} = 2 - \frac{1}{m}$$

LS is $(2 - \frac{1}{m})$ -approx.

$$\begin{aligned}ms_i &\leq \sum_{j \neq i} p_j = \frac{1}{m} \left(\sum_j p_j - p_i \right) \\&= \frac{1}{m} \sum_j p_j - \frac{1}{m} p_i \\&\leq T^* - \frac{1}{m} p_i\end{aligned}$$

$$\begin{aligned}T = c_i &= s_i + p_i \\&\leq T^* + \left(1 - \frac{1}{m}\right) p_i\end{aligned}$$

Sorting-Scheduling algorithm

Sorting-Scheduling algorithm (JH 4.2.1.5)

Longest Processing Time (LPT) rule:

- ▶ sorting non-increasingly
- ▶ applying LS

1. M_i : with the maximum load
2. J_i : the last job on M_i

$$|M_i| = 1 \implies T = T^*$$

$$|M_i| \geq 2 \implies p_i \leq \frac{1}{2}T^*$$

$$\implies T = s_i + p_i \leq \left(\frac{3}{2} - \frac{1}{2m}\right)T^*$$

LPT rule is $(\frac{4}{3} - \frac{1}{3m})$ -approx.

$$p_1 \geq p_2 \geq \cdots \geq p_n$$

CASE $p_i \leq \frac{1}{3}T^*$:

$$T \leq (\frac{4}{3} - \frac{1}{3m})T^*$$

CASE $p_i > \frac{1}{3}T^*$:

$p_i \equiv p_n$ (w.l.o.g: T unchanged; T^* not smaller)

$$\implies p_1 \geq p_2 \geq \cdots \geq p_n > \frac{1}{3}T^* \implies |M_i| \leq 2$$

$$\implies n \leq 2m \implies n = 2m - h \xrightarrow[\text{argument}]{\text{exchange}} T = T^*$$

$(\frac{4}{3} - \frac{1}{3m})$ -approx. is tight

$$n = 2m + 1$$

$$\text{LPT: } J_1 = x, J_{2m} = y, J_{2m+1} = z$$

$$\text{OPT: } J_{2m-1} = J_{2m} = J_{2m+1} = y$$

$$\text{vs. } \frac{x + 2y}{3y} = \frac{4}{3} - \frac{1}{3m}$$

$$J = \{2m - 1, 2m - 1, \dots, m + 1, m + 1, m, m, m\}$$

PTAS for MS

1. M_i : with the maximum load
2. J_i : the last job on M_i

$$T = s_i + p_i \leq T^* + p_i$$

1. $J = J_L \triangleq \{\text{long jobs}\} \uplus J_S \triangleq \{\text{short jobs}\}$
2. S_L : the optimal schedule for J_L
3. S : apply List-Scheduling to S_L and J_S

Reference

- ▶ “The Design of Approximation Algorithms” by David P. Williamson and David Shmoys, 2011 (Section 3.2).

PTAS for MS

1. Split J :

$$J_i \in J_S \iff p_i \leq \epsilon \cdot \frac{1}{m} \sum_j p_j$$

$$\implies |J_L| < \frac{1}{\epsilon} \cdot m$$

2. Time for S_L (m being a constant!):

$$m^{\frac{1}{\epsilon} \cdot m} \cdot O(n)$$

3. Approx. ratio ($p_i \in J_S$ case):

$$T = s_i + p_i \leq \frac{1}{m} \sum_j p_j + \epsilon \cdot \frac{1}{m} \sum_j p_j$$

$$= (1 + \epsilon) \frac{1}{m} \sum_j p_j$$

$$\leq (1 + \epsilon) T^*$$

No FPTAS for MS

Theorem ($MS \in PTAS \setminus FPTAS$)

No FPTAS for MS.

MS is strongly NP-complete \implies MS with $\max_j p_j \leq q(n)$ is NP-complete.

Reference

- ▶ “The Design of Approximation Algorithms” by David P. Williamson and David Shmoys, 2011 (Section 3.2).

No FPTAS for MS

Theorem

$\exists \text{FPTAS for MS} \implies \text{MS} \in \text{P}.$

$$A_\epsilon : \epsilon = \frac{1}{\lceil 2nq(n) \rceil}$$

$$\begin{aligned}(1 + \epsilon)T^* &= T^* + \epsilon \cdot T^* \\ &\leq T^* + \frac{1}{\lceil 2nq(n) \rceil} \cdot nq(n) \\ &\leq T^* + \frac{1}{2}\end{aligned}$$

$$\text{Time: } \text{Poly}\left(\frac{1}{\epsilon}, n\right) = \text{Poly}(\lceil 2nq(n) \rceil, n) = \text{Poly}(n)$$
